

Learn About PureVPN's Portforwarding Addon

Port Forwarding is an application of NAT that redirects a communication request from one address and port number combination to another while traffic passthrough such as a router. PortForwarding gives you complete peace of mind. It prevents hackers, surveillance agencies, and malicious bots from reaching your computer and mobile devices.

It activates a strong, configurable firewall right on our server end to fight and kill your enemies giving you a virtual protection shield when connected with the VPN. Port Forwarding rules are also configurable from within your [Client Area](#).
